

ABSTRACT:

A pot lid and/or cooking utensil holder for use on a counter or table surface to receive a hot, dripping pot or pan lid, as well as most common cooking utensils while cooking. The device contains a relatively planar base comprising a wall extending vertically at each end in parallel. One of the walls extends higher than the other and contains a large v shaped opening to permit the knob or handle of a lid or utensil to rest within. The two walls are spaced apart to allow a pot lid to be placed vertically within the space, resting on the anterior surface of the base and leaning at an angle against the higher lateral wall. The anterior surface of the base includes a depressed area or channel in which to capture drippings from the lid or utensil.
